DETAILED ACTION

Response to Arguments

Applicant's arguments filed 4/20/07 have been fully considered but they are not persuasive.

Applicant argues that nothing in Anumakonda, Wojtowicz, Isogaya, Marchand, or Metius, alone or in combination, discloses or suggests a plurality of catalytic partial oxidation reactors disposed in a shell parallel to and spaced from one another such that each is offset from another.

However, the claim recites, "...a plurality of catalytic partial oxidation reactors disposed in a shell parallel to and spaced from one another that each is offset from another". This limitation appears to be broad in that multiple configurations can be represented by the recitation "parallel to and spaced from one another that each is offset from another"; this recitation does not specifically limit the distances or configuration of the catalytic partial oxidation reactors.

As to the limitation of the plurality of reactors disposed in a shell, from the combined teachings, it is known to use a reformer disposed in a shell (Marchand, paragraph 0017). From this disclosure and the teaching of using multiple reactors in the disclosure Metius, one of ordinary skill in the art would be motivated to dispose the multiple reactors in the shell in order to limit heat loss and maximize heat transferred to the heat exchange fluid, as this would require routine experimentation.

Because disposing multiple reactors in the shell is obvious over the combined prior art, the configuration of the reactors that would result from disposing multiple

each is offset from another" for the reasons given above.

Page 3

Additionally, the applicant appears to be arguing apparatus limitations. However, the current claims are drawn to a process. It is unclear how the apparatus limitations lend a patentable distinction the process claims instantly pending. The prior art teach a substantially similar process as that of the currently claimed invention such that the apparatus of the prior art is substantially capable of performing the process of the current invention.

Applicant argues that the combination of references does not teach or suggest passing a heat exchange fluid through a shell past a plurality of catalytic partial oxidation reactors in the same direction of reactant flow such that heat from the reactor transfers to the heat exchange fluid and is then transferred to hydrocarbon fuel prior to feeding it into the catalytic partial oxidation reactors to vaporize the hydrocarbon fuel.

However, the limitations of passing a heat exchange fluid in the same direction of reactant flow such that heat from the reactor transfers to the heat exchange fluid and is then transferred to hydrocarbon fuel prior to feeding it into the catalytic partial oxidation reactors to vaporize the hydrocarbon fuel are suggested by Marchand et al. (at least one passage of the heat-exchanger extends through at least a portion of the reaction chamber (paragraph 0073, lines 5-8) for the purpose of using the heat supplied by the exothermic oxidation for other parts of the reaction downstream (paragraph 0133)) and Wojtowicz (a process for producing hydrogen rich gas for use in a fuel cell produced

from a hydrocarbonaceous material (paragraph 0019) wherein heat from an oxidation reaction is transferred for the purpose of heating an inlet stream (paragraph 0079, lines 15-24)).

Applicant argues that the disclosures of Isogaya, Wojtowicz, and Marchand do not provide motivation for placing multiple reactors in a shell, parallel to and spaced from one another.

However, Isogaya, Wojtowicz, and Marchand are not relied upon to provide motivation for placing multiple reactors in a shell, parallel to and spaced from one another. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 7-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Anumakonda et al. (U.S. 6221280) in view of Wojtowicz et al. (U.S. 2002/0041986) and Isogaya et al. (U.S.4331451) and Metius et al. (U.S. 6602317) and Marchand et al. (U.S. 2002/0114747).

Anumakonda et al. teach a process for catalytic partial oxidation of hydrocarbon fuel (col. 7, lines 40-44) wherein feeding heavy hydrocarbons such as kerosene are reacted with an oxidizer gas in a partial oxidation reactor in the presence of a noble metal catalyst at a temperature of about 1050° C (col. 5, lines 25-44) wherein the reaction product gas mixture comprising hydrogen and carbon monoxide (col. 5, lines 45-48) is fed to a solid oxide fuel cell system (fuel cell system inherently teaches producing electric power, col. 7, lines 1-4). Anumakonda et al. fail to teach passing a

heat exchange fluid through the shell and past the at least one catalytic partial oxidation reactor with the heat exchange fluid in the shell flowing in the same direction of reactant flow in the catalytic partial oxidation reactor tube such that heat from partial oxidation in the at least one catalytic partial oxidation reactor transfers from the at least one catalytic partial oxidation reactor to the heat exchange fluid in the shell.

Wojtowicz et al. teach a process for producing hydrogen rich gas for use in a fuel cell produced from a hydrocarbonaceous material (paragraph 0019) wherein heat from an oxidation reaction is transferred for the purpose of heating an inlet stream (paragraph 0079, lines 15-24).

Isogaya et al. teach a process for catalytic gasification of heavy distillate such as a kerosene stream (col. 4, lines 5-10) wherein the hydrocarbon inlet is vaporized (col. 5, lines 5-15) and the temperature of the inlet must be higher than 500°C (col. 5, lines 13-15) for the purpose of preventing the deposition of carbon on the catalyst bed (col. 5, lines 15-17).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide heat from an oxidation reaction transferred to an inlet stream (Wojtowicz et al., paragraph 0079, lines 15-24) in Anumakonda et al. in order to prevent the deposition of carbon on the catalyst bed (Isogaya et al., col. 5, lines 15-17) as taught by Wojtowicz et al. and Isogaya et al.

The teaching of the combined references that the inlet is maintained at a temperature of 500°C inherently meet the limitation of vaporizing the hydrocarbon fuel.

As to the limitation of the heat exchange fluid in the shell flowing in the same direction of reactant flow in the catalytic partial oxidation reactor tube, Marchand et al. teach a process for converting hydrocarbon into a stream containing hydrogen (paragraph 0001, lines 1-5) wherein a closed vessel having a reformate inlet and a reformate outlet for receiving and discharging, respectively, a reformate stream, and having a coolant inlet and a coolant outlet for receiving and discharging, respectively a coolant fluid stream (coolant fluid stream is heat-exchanger, paragraph 0065) wherein at least one passage of the heat-exchanger extends through at least a portion of the reaction chamber (paragraph 0073, lines 5-8) for the purpose of using the heat supplied by the exothermic oxidation for other parts of the reaction (paragraph 0133).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide a closed vessel having a reformate inlet and a reformate outlet for receiving and discharging, respectively, a reformate stream, and having a coolant inlet and a coolant outlet for receiving and discharging, respectively a coolant fluid stream (coolant fluid stream is heat-exchanger, paragraph 0065) wherein at least one passage of the heat-exchanger extends through at least a portion of the reaction chamber (paragraph 0073, lines 5-8) in Anumakonda et al. in order to use the heat supplied by the exothermic oxidation for other parts of the reaction (paragraph 0133) as taught by Marchand et al.

As to the limitations regarding a plurality of catalytic partial oxidation reactors, it would be obvious to one of ordinary skill in the art to have multiple partial oxidation

reactors in series, as it would have been would have been routine experimentation to determine optimum conditions for carrying out the reaction. It would have been further obvious that multiple reactors would be in a parallel series and offset from another by a predetermined distance (reactors offset from each other).

If the limitations regarding a plurality of catalytic partial oxidation reactors are not obvious over Anumakonda et al., Metius et al. teaches that it is known to have multiple partial oxidation reactors producing hydrogen and carbon monoxide (Throughout document, particularly col. 6, lines 45-50).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide multiple partial oxidation reactors producing hydrogen and carbon monoxide (Throughout document, particularly col. 6, lines 45-50) because it well known to have multiple partial oxidation reactors as taught by Metius et al.

Additionally, it would have been further obvious to dispose the multiple reactors in a shell parallel to and spaced from one another such that each is offset from another as optimum operating conditions would be readily determined through routine experimentation (reactors offset from each other).

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul A. Wartalowicz whose telephone number is (571) 272-5957. The examiner can normally be reached on 8:30-6 M-Th and 8:30-5 on Alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stanley Silverman can be reached on (571) 272-1358. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
